Optimal supply and absorption of manganese.

TourTurf® FS Manganese Liquid Mn 12 % is a mineral liquid N-fertiliser with manganese for sandy rootzones. Sandy soils have a particularly high demand for additional manganese to prevent manganese deficiency and to maintain the resistance of turf against Take All Patch.

The TourTurf® FS Range includes fertilisers that provide balanced growth, produce vital grasses and pH control of the tank-mix. The use of these products ensures optimal supply and absorption of macronutrients, micronutrients and trace elements. An economical solution for optimal use of nutrients, without any leaching losses or negative environmental impact.

The fertiliser can be used throughout the growing season. You can optionally add biostimulants such as seaweed, humic acid and amino acid products. Always check mixability first. A jar test will help you to ensure the compatibility of different products.

Used to feed manganese directly to the plant. This works best when used as foliar fertiliser. If there is a manganese deficiency, manganese should be fertilised throughout the growing season, preferably once a month. The product can be mixed with other TourTurf® FS Range fertilisers. The product can be applied with any type of sprayer. The fertiliser must be mixed with water in a minimum ratio of 1:4. We recommend using spray nozzles for larger droplets.

Guaranteed content

Total nitrogen (N)	2.0%
- of which urea (N)	2.0%
Manganese (Mn)	12.0%
Sulphur (SO ₃)	7.3%

Application

Use monthly during growing season.

10-20L/ha mixed in 200-600 L water.

Synergy with PHB
