Spreader and penetrant to accelerate the effect of TourTurf® TSC.

TourTurf® TSA Turf Surface Accelerator is an innovative spreader and penetrant that will boost the performance of TourTurf® TSC Turf Surface Conditioner under difficult growing conditions where moss or silver moss invasion on golf greens is a problem. Use TourTurf® TSA to improve the soil and tissue penetration.

Once established on a green, moss is difficult to control and challenging to get rid of. Silver moss, by its nature, develops well in dry and sandy soil. Therefore, often a problem and nuisance on tees and greens.

TourTurf® TSA is designed to be tank-mixed with TourTurf® TSC to reduce invasion of moss and silver moss and product penetration through the surface, ensuring contact throughout the moss structure.

This optimises deposition, contact coverage and aids retention of the product, which in turn, changes the root zone environment to discourage moss.

TourTurf® TSA provides extreme performance characteristics like reduction of surface tension and spreading. The reduction in surface tension gives the super wetting performance. It increases the droplet spread at the leaf surface by up to 50% after 60 seconds.

Guaranteed content

A blend of surfactants, wetting agents and spreaders. 100 % biodegradable.

Application

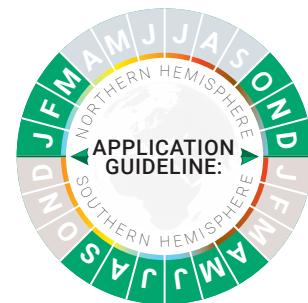

Always use with TSC.

5L TSA and 40L TSC mixed in 500 L of water per ha.

Synergy with TSC & PTC

Order number

8339
4 x 5 litres per carton
