Natural Zeolite with a high cation exchange and water holding capacity.

TourTurf® ZSC is an Italian oven dried and sterilized chabazite zeolite. Approved by the USGA as an inorganic amendment in the construction of putting greens. The product has extraordinary chemical-physical properties, such as high and selective cation exchange capacity and high water retention. It helps improve turf root zone quality, reduce irrigation needs, minimise nutrient leaching, and support sustainable turf management by enhancing nutrient availability and use efficiency (NUE).

It can help you improve the quality of your turf root zone, protect the environment by saving irrigation water, avoid leaching of nutrients, and make your turfgrass management more sustainable by increasing nutrient availability and using nutrients efficiently.

TourTurf® ZSC is recommended for the construction and soil improvement of sandy soils such as golf greens and professional football pitches. It is also beneficial in deep soil coring for improving soils with poor fertility or with poor water retention.

Zeolites absorb up to 55% of their weight in water and release it slowly, helping prevent root rot and drought stress. Ideal for treating Localised Dry Spots and Fairy Rings. After aeration, backfill holes with TourTurf® ZSC and saturate with water. Use a quality wetting agent for best results.

TourTurf® ZSC also increases drainage, porosity and soil oxygenation. This is how it reduces the leaching of nutrients and increases soil fertility.

Guaranteed content

Zeolite	68.0%
- of which chabazite.....	65.0%
- of which philipsite.....	3.0%
Sanidino.....	5.0%
Augite.....	3.0%
Illite, mica, biotite	2.0%
Vetro vulcanico.....	18.0%
CEC	246 meq/100g

Application

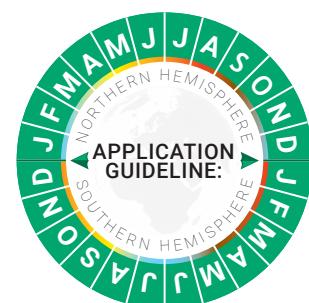

Use when needed.

Dry Patch: 10kg/100m²
Grow-In: 1500kg/ha.
Deep aeration & renovation:
 2000kg/ha. All year when dry.
Divot mix & potting soil:
 5kg/m³

Size 0.7-1.2mm.
 SGN 120.
 Synergy with EXC

Order number
